

## What we do

We use polymer adsorption to extract hydrocarbons from all types of media:

Our process is:

**eco-friendly:** the Adsorpol® is recyclable and reusable up to 100 times, has certified eco-neutrality, & the process allows hydrocarbon recovery for further use/valorization

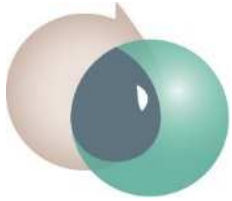

**versatile:** 2 options for process implementation, a complete range of adsorbing agents, and flexible sizing to adapt to each case specifics

**efficient** on all media types : water, soil, and sludge

**very cost competitive** thanks to reusability and low CAPEX & OPEX costs

## Our markets

### Environmental remediation :

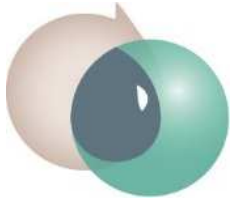

- in France alone, government databases list 2300 sites in need of remediation, nearly half of them containing hydrocarbons
- global market for remediation was 50 billion USD in 2012

### Produced water treatment :

- international standards require  $[HC_t] < 30$  ppm for produced water effluents discharge
- 110 billion barrels of produced water are produced each year and require proper treatment

## Our solutions

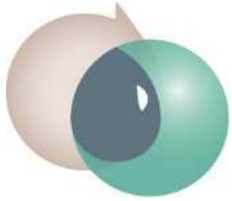

Today:

- **onsite remediation services** using mobile or static units : brownfields, industrial sites, tank cleaning,...
- **design and engineering of custom units** for large scale remediation and produced water management

Tomorrow:

- **sale of proprietary licences** for our remediation and produced water processes
- **sale of Adsorpol<sup>®</sup>**

## Our objectives and needs

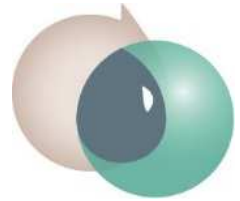

Rev :     **2015: 600 K€**     2016: 1 400 K€     2017: 3 000 K€     2018 : 5 000 K€

- **1<sup>st</sup> project** for helping to dismantle a closed refinery in Normandy
- **Advanced negotiations with client-partner** for on-site testing of polishing units operating on gas offshore platforms produced water

Needs :

- **Capital increase of 5 M€** for financing industrial-size prototypes construction and HR development
- **Patent developments** for international applications

**Thank you!**
